

MultiLink for OpenText Data Integrator Enterprise

Distribute and balance load across multiple servers

Benefits

- Support distributed deployment
- Enable horizontal scalability
- Ensure fault tolerance and high availability
- Balance workloads for security, performance, SLAs

Paired with OpenText™ Data Integrator Enterprise, MultiLink empowers your business to handle growing data volumes, avoid downtime during upgrades, and launch new high-volume projects without affecting existing traffic—all within a centrally managed environment.

Expand your OpenText Data Integrator environment

MultiLink expands OpenText Data Integrator and transformation deployment options beyond a single server into a distributed architecture enabling multiple servers to function as a single environment. The solution coordinates the workload through shared database and file system resources to optimize performance.

Built-in scalability and failover

For basic capacity expansion, use MultiLink to add a second instance of OpenText Data Integrator and provide needed performance headroom. With this solution, the servers monitor each other, ensuring that no transactions are orphaned in case of a server outage.

Automated failover capabilities seamlessly maintain file transfer service during scheduled maintenance. As servers monitor each other, automatic load balancing ensures that no single server becomes overburdened when other resources have available bandwidth.

Segregate component services

OpenText Data Integrator servers comprise several component services, and MultiLink allows you to segregate and distribute them for better management and planning. Administration and reporting services, for example, can be segregated from file routing or data transformation.

Transports and agents can be assigned to specific MultiLink servers by System ID. By isolating workloads to dedicated resources, you can isolate the impact of one application on the rest of the infrastructure while retaining the value associated with centralized configuration, reporting, and audit.

Availability and pricing

MultiLink is available for all OpenText Data Integrator platforms, except for solutions designed specifically to enable information exchange on the IBM iSeries/AS400. Additional license fees and maintenance charges apply. Data Transformation is an optional feature.

MultiLink extends the power of Data Integrator, enabling organizations to scale operations, maintain high availability, and optimize performance—without disruption. With distributed deployment, built-in fault tolerance, and intelligent workload balancing, MultiLink helps future-proof your infrastructure to meet the demands of modern B2B integration.
